Optilume: ¿Compite con la uretroplastia? Datos, comparación

Moisés Rodríguez Socarrás, ICUA - Madrid, Spain
Septiembre 2023

Background

- ✓ **Paclitaxel** es un taxano, con actividad anticancerigena qu es es capaz de inhibir el crecimiento de fibroblastos y la formación de cicatricez.
- ✓ Stents recubiertos de Paclitaxel han sido utilizados con exito en estenosis coronarias recurrentes y han sido introducidos recientemente en urologia como opcion de tratamiento para estenosis de uretra.

Long-term clinical outcomes of everolimus-eluting stent versus paclitaxel-eluting stent in patients undergoing percutaneous coronary interventions: a meta-analysis

Min Meng[1], Bei Gao[1], Xia Wang[1], Zheng-gang Bai[2], Ri-na Sa[1] and Bin Ge[1*]

Abstract

Background: Everolimus -eluting stent (EES) is common used in patients undergoing percutaneous coronary interventions (PCI). Our purpose is to evaluate long-term clinical outcomes of everolimus -eluting stent (EES) versus paclitaxel-eluting stent (PES) in patients undergoing percutaneous coronaryinterventions (PCI) in randomized controlled trials (RCTs).

Methods: We searched Medline, EMBASE, Cochrane Library, CNKI, VIP and relevant websites (https://scholar-google-com.ezproxy.lib.usf.edu/) for articles to compare outcomes between everolimus-eluting stent and paclitaxel-eluting stent without language or date restriction. RCTs that compared the use of everolimus -eluting stent and paclitaxel-eluting stent in PCI were included. Variables relating to patient, study characteristics, and clinical endpoints were extracted. Meta-analysis was performed using RevMan 5.2 software.

Results: We identified 6 published studies (from three randomized trials) more on everolimus-eluting stent ($n = 3352$) than paclitaxel-eluting ($n = 1639$), with follow-up duration ranging from 3, 4 and 5 years. Three-year outcomes of everolimus-eluting stent compared to paclitaxel-eluting were as following: the everolimus-eluting stent significantly reduced all-cause death (relative risk [RR]:0.63; 95 % confidence interval [CI]: 0.46. to 0.82), MACE (RR: 0.56; 95 % CI: 0.41 to 0.77), MI (RR: 0.64; 95 % CI: 0.48 to 0.86), TLR (RR: 0.72; 95 % CI: 0.59 to 0.88), ID-TLR (RR: 0.74; 95 % CI: 0.59 to 0.92) and ST (RR: 0.54; 95 % CI: 0.32 to 0.90). There was no difference in TVR between the everolimus-eluting and paclitaxel-eluting (RR: 0.76; 95 % CI: 0.58 to 1.10); Four-year outcomes of everolimus-eluting compared to paclitaxel-eluting: the everolimus-eluting significantly reduced MACE (RR: 0.44; 95 % CI: 0.18 to 0.98) and ID-TLR (RR: 0.47; 95 % CI: 0.23 to 0.97). There was no difference in MI (RR: 0.48; 95 % CI: 0.16 to 1.46), TLR (RR: 0.46; 95 % CI: 0.20 to1.04) and ST ((RR: 0.34; 95 % CI: 0.05 to 2.39). Five-year outcomes of everolimus-eluting stent compared to paclitaxel-eluting: There was no difference in ID-TLR (RR: 0.67; 95 % CI: 0.45 to 1.02) and ST (RR: 0.71; 95 % CI: 0.28 to1.80).

Conclusions: In the present meta-analysis, everolimus-eluting appeared to be safe and clinically effective in patients undergoing PCI in comparison to PES in 3-year clinical outcomes; there was similar no difference in reduction of ST between EES and PES in long-term(≥4 years) clinical follow-ups. Everolimus-eluting is more safety than paclitaxel-eluting in long-term clinical follow-ups, whether these effects can be applied to different patient subgroups warrants further investigation.

CONCLUSIONS

The results of this randomized controlled trial support that Optilume DCB is safe and superior to standard DVIU/dilation for the treatment of recurrent anterior urethral strictures <3 cm in length. Superior outcomes were observed for freedom from repeat treatment at 1 year, anatomical success at 6 months and functional success at 1 year. We will continue to follow these men for 5 years. The Optilume DCB may serve as an important alternative for men who have had an unsuccessful DVIU/dilation but who want to avoid or delay urethroplasty.

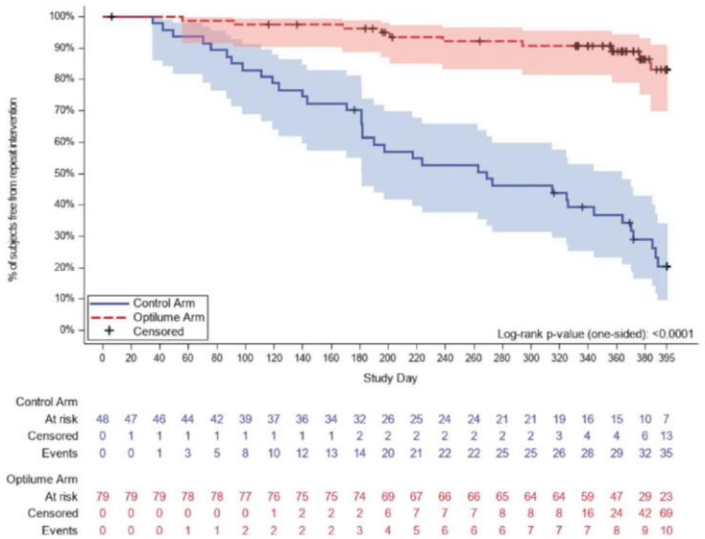

Figure 3. Kaplan-Meier curve of freedom from repeat intervention through 1 year.

Dilatacion con Balon recubierto paclitaxel (Optilume) N= 17 pacientes

Edad	28 –81
Tiempo seguimiento	9 (3-18) meses
Intervenciones previas	
• Uretroplastias	4
• Laser de prostatata	3
• Prostatectomia radical	2
• otras	3
Q max 1 / 3 / 12 meses	14 / 17 /16 ml/seg
fallido	1
Fracasos	2

Indicaciones

iCUA
INSTITUTO DE CIRUGÍA UROLÓGICA AVANZADA

- ✓Estenosis < 3cm
- ✓Primarias, recidivas uretroplastia, estenosis yuxtaesfinterianas post-HoLEP

Poco recomendable (Atención probabilidad de fracaso):

- Esclerosis de cuello post Prostatectomia radical
- Esclerosis uretra prostatitca posradioterapia (Fibrosis)
- Esclerosis de celda restos adenomatosos, postadenomectomia..

iCUA
INSTITUTO DE CIRUGÍA UROLÓGICA AVANZADA

Conclusion

- Alternativa para el tratamiento de estenosis de uretra < 3 cm
