DOI:10.1097/MOU.0000000000000854

KEY POINTS

- The feasibility of suctioning PCNL techniques has been proved with the advantages of higher SFR, less postinfectious complications and higher fragmentation efficiency.
- The application of a real-time intrarenal pressure sensor in suctioning PCNL devices will help to monitor the pressure in procedures and reduce the risk of infection-related complications.
- Suctioning PCNL is a cost-effective treatment strategy in the management of renal stones.
- Most of current suctioning PCNL studies were retrospective design; higher level of evidence is required to further confirm the safety and application of this technique.

2023

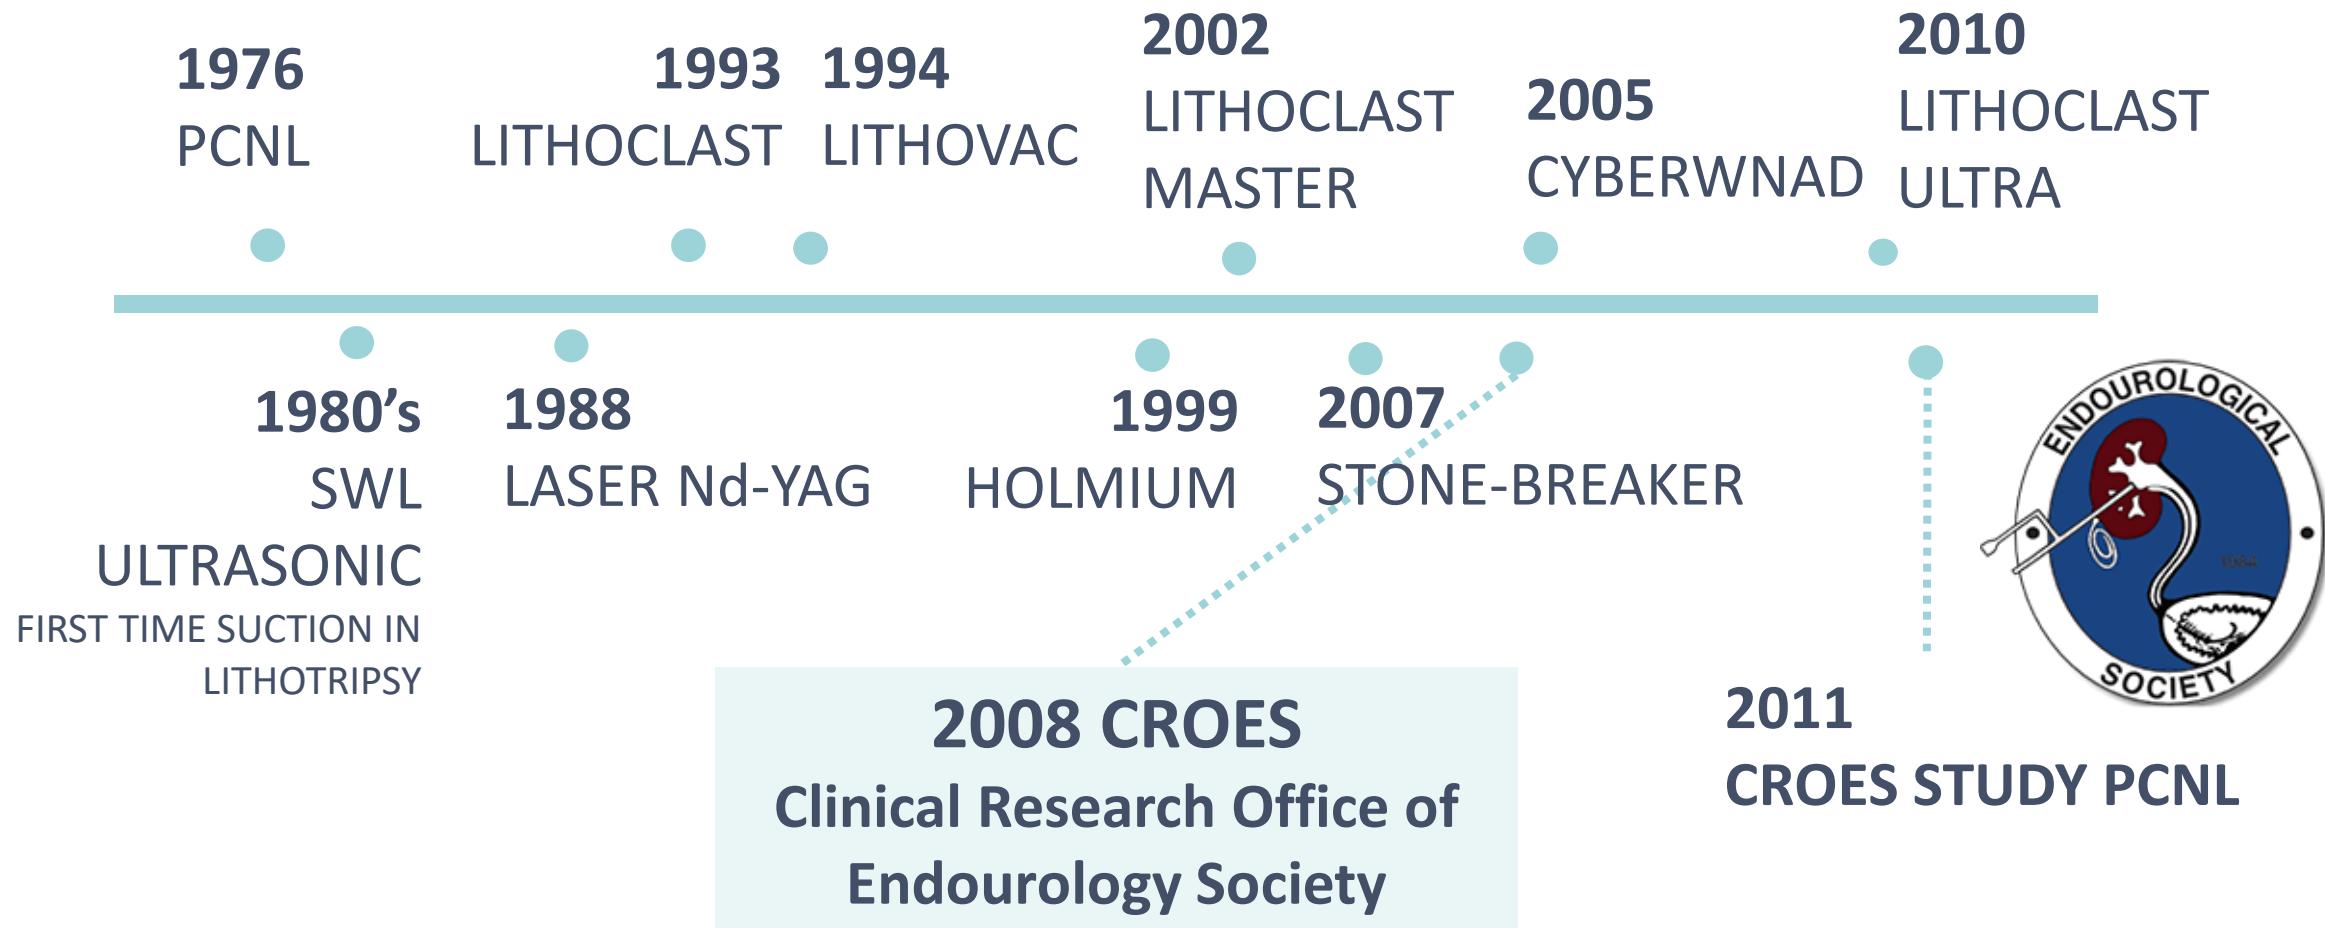

KEY POINTS

- Prospective and randomized controlled trial (RCT) demonstrated increased SFR and reduced complication rates using suctioning devices in PNL procedures.
- RCT demonstrated favorable SFR in mini PNL procedures.
- Retrospective and comparative demonstrated increased SFR and reduced complication rates using suctioning devices in RIRS.
- Multicenter RCTs are needed to further confirm these observations.

PROSPECTIVE RCT

- BETTER SFR**
- LESS COMPLICATIONS**
- SFR miniPCNL**
- SUCTION DEVICES**

Comparison of two different minimally invasive percutaneous nephrostomy sheaths for the treatment of staghorn stones

Guibin Xu, Jian Liang¹, Yongzhong He, Xiezhao Li, Weiqing Yang, Dehui Lai¹, Haibo Zhao and Xun Li

Department of Urology, The Fifth Affiliated Hospital of Guangzhou Medical University, Guangzhou, Guangdong, China
Guibin Xu and Jian Liang are first co-authors and contributed equally to this work.

OUTCOMES		
N = 60	18Fr VAAS	20Fr NS
Stone diameter	4,2cm	3,8cm
Stone density	998 UH	1031 UH
Middle Calyx	83,3%	76,6%
Time	64,3 ± 29min	72,9 ± 28min
RPP > 30mmHg	20%	96,7%
Clavien I	6,6%	20%
Clavien II	6,6%	13,33%
STONE FREE	90,0%	76,6%

There is some evidence for using suction during PNL to reduce IRP and increase SFR

3.4.7.1. Summary of evidence and recommendations for endourology techniques for renal stone removal

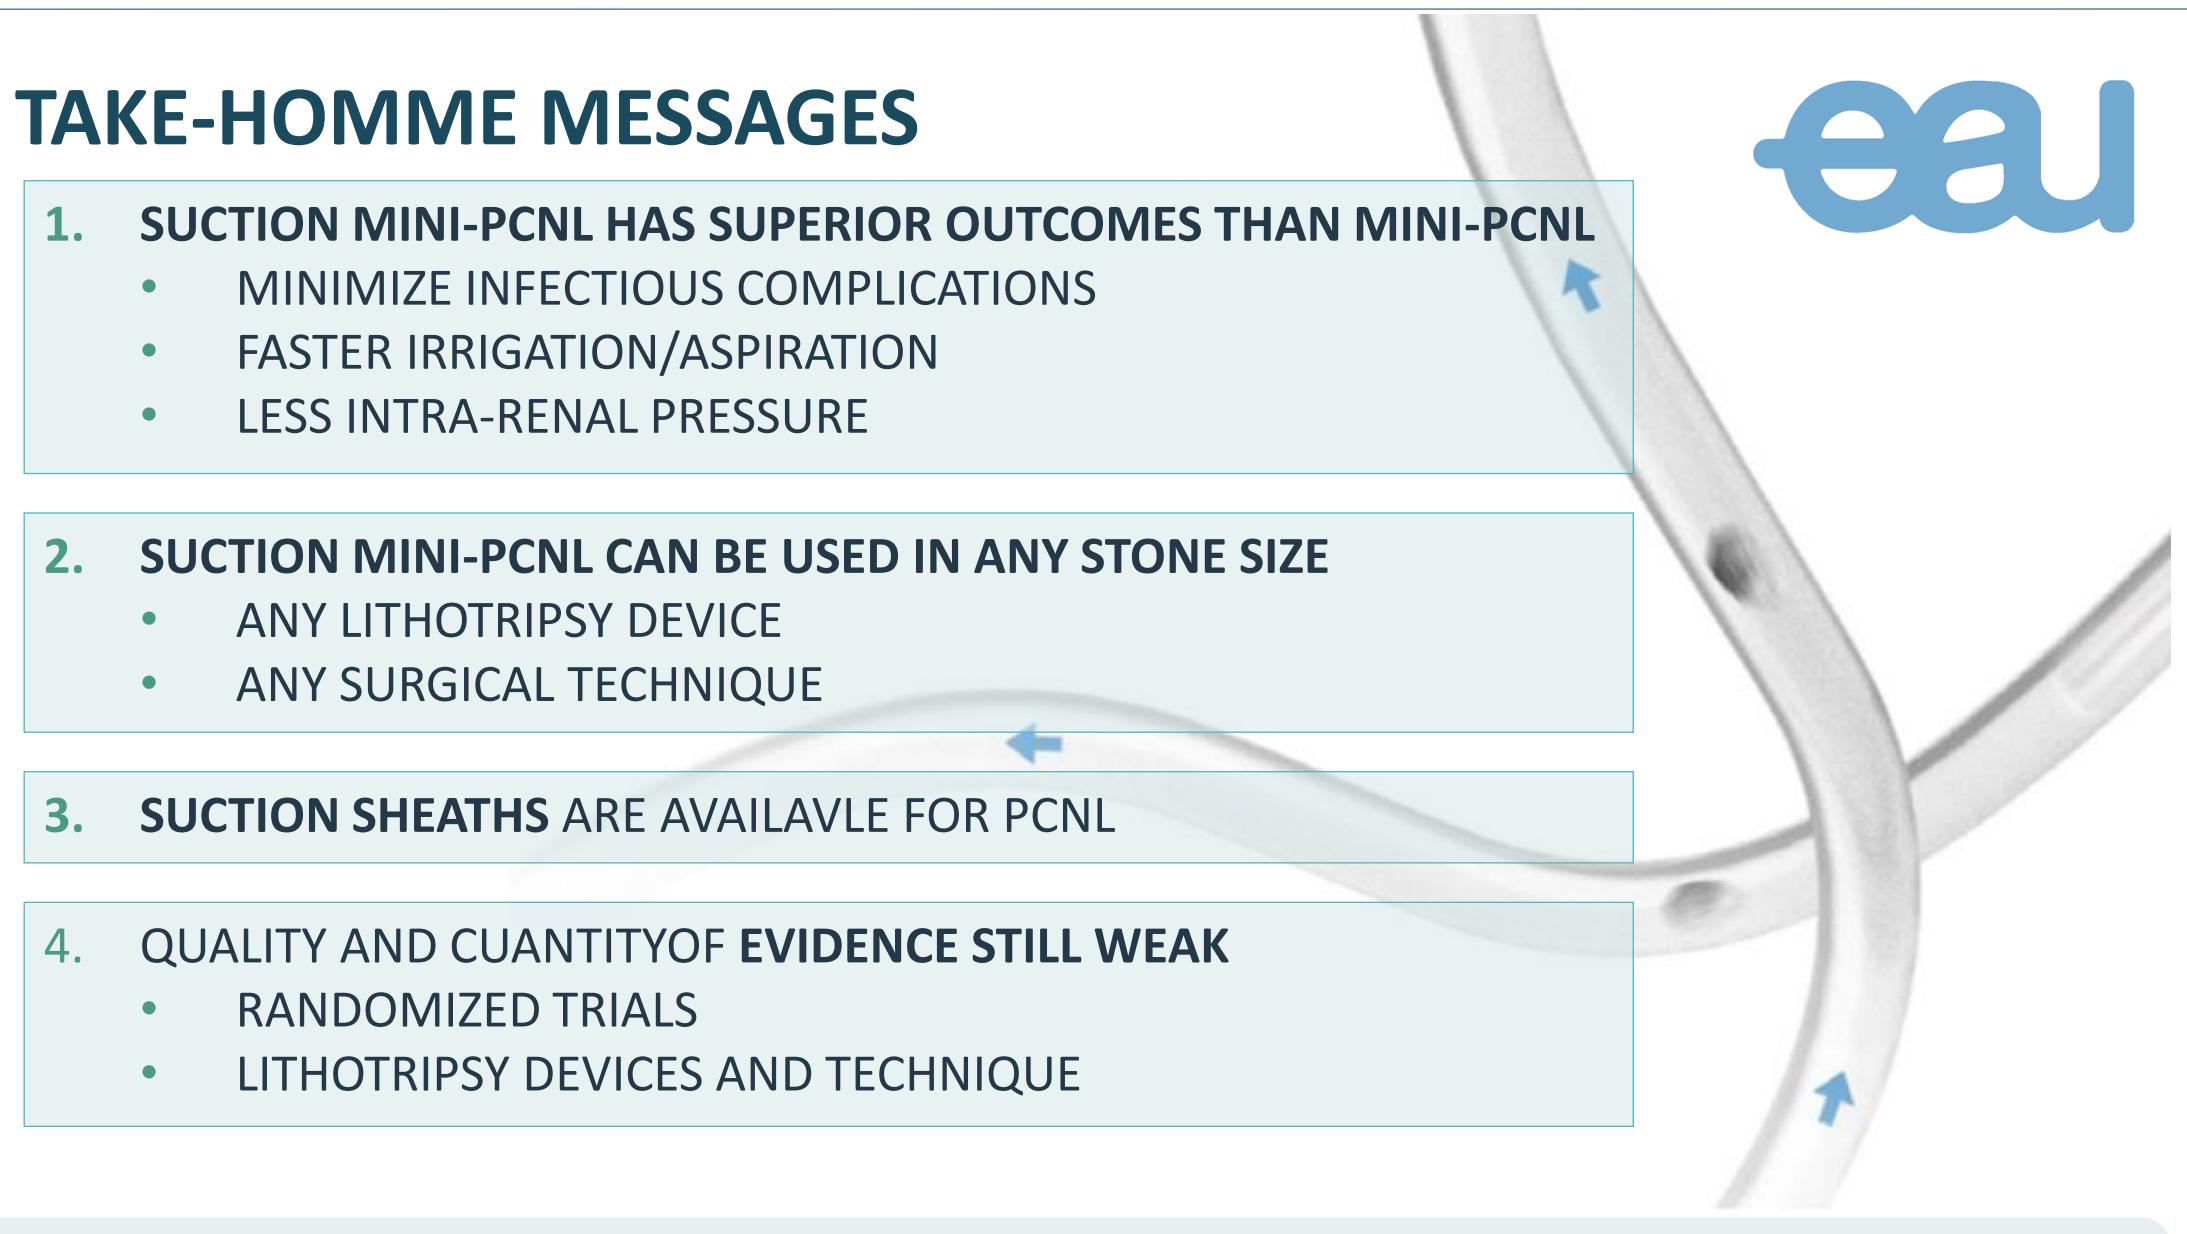

Summary of evidence	LE
Imaging of the kidney with US or CT can provide information regarding inter-positioned organs within the planned percutaneous path (e.g., spleen, liver, large bowel, pleura, and lung).	1a
Both prone and supine positions are equally safe with equivalent SFR.	1a
Percutaneous nephrolithotomy performed with small instruments tends to be associated with significantly lower blood loss, but the duration of procedure tended to be significantly longer. There are no significant differences in SFR or any other complications.	1a
In uncomplicated cases, a totally tubeless PNL results in a shorter hospital stay, with no increase in complication rate.	1a
Peri-operative use of tranexamic acid may reduce bleeding complications and transfusion rates.	1a
Urine culture taken directly from the renal pelvis or a stone culture are more predictive of post-PNL sepsis than a pre-operative midstream urine culture.	1a

RECOMMENDATIONS 1a

- US –TC INFORMATION PREOP
- PRONED – SUPINE: EQUIVALENT
- SMALL PCNL TRACTS
 - LOWER BLOOD LOSS
 - LONGER SURGERY
 - NO SFR DIFFERENCES
- TUBELESS IN SOME CASES
- TRANEXAMIC ACID
- URINE CULTURE FROM RENAL PELVIS

TAKE-HOMME MESSAGES

- 1. SUCTION MINI-PCNL HAS SUPERIOR OUTCOMES THAN MINI-PCNL**
 - MINIMIZE INFECTIOUS COMPLICATIONS
 - FASTER IRRIGATION/ASPIRATION
 - LESS INTRA-RENAL PRESSURE
- 2. SUCTION MINI-PCNL CAN BE USED IN ANY STONE SIZE**
 - ANY LITHOTRIPSY DEVICE
 - ANY SURGICAL TECHNIQUE
- 3. SUCTION SHEATHS ARE AVAILABLE FOR PCNL**
- 4. QUALITY AND QUANTITY OF EVIDENCE STILL WEAK**
 - RANDOMIZED TRIALS
 - LITHOTRIPSY DEVICES AND TECHNIQUE
